

# FLASH sample results for KITP turbulence code comparison

Test problem 1, pure hydro and MHD

Christoph Federrath

and

Robi Banerjee

ZAH Heidelberg, April 2008

initial conditions and project description at

<http://kitpstarformation07.wikispaces.com/Star+Formation+Test+Problems>

FLASH3 code info at

<http://flash.uchicago.edu/website/codesupport>

# FLASH results – pure hydro (HD)

---

initial conditions: developed snapshot from a solenoidally driven isothermal turbulence simulation with periodic boundary conditions and rms Mach number  $\sim 9$  without magnetic fields

4 simulations:

256<sup>3</sup> grid points with  $\gamma=1.001$  to approximate an isothermal eos

256<sup>3</sup> grid points with with a polytropic eos and  $\Gamma=1.0$  (proper isothermal)

512<sup>3</sup> grid points with with a polytropic eos and  $\Gamma=1.0$  (proper isothermal)

1024<sup>3</sup> grid points with with a polytropic eos and  $\Gamma=1.0$  (proper isothermal)

hydro solver: PPM (Colella & Woodward 1984)

analysis in terms of projections, slices, PDFs, spectra, structure functions, time evolution plots

# FLASH results – magnetic runs (MHD)

---

initial conditions: developed snapshot from a solenoidally driven isothermal turbulence simulation with periodic boundary conditions and rms Mach number  $\sim 9$  with magnetic fields tuned to minimize  $\text{div } B$

3 simulations:

128<sup>3</sup> grid points with with a polytropic eos and  $\Gamma=1.0$  (proper isothermal)

256<sup>3</sup> grid points with with a polytropic eos and  $\Gamma=1.0$  (proper isothermal)

512<sup>3</sup> grid points with with a polytropic eos and  $\Gamma=1.0$  (proper isothermal)

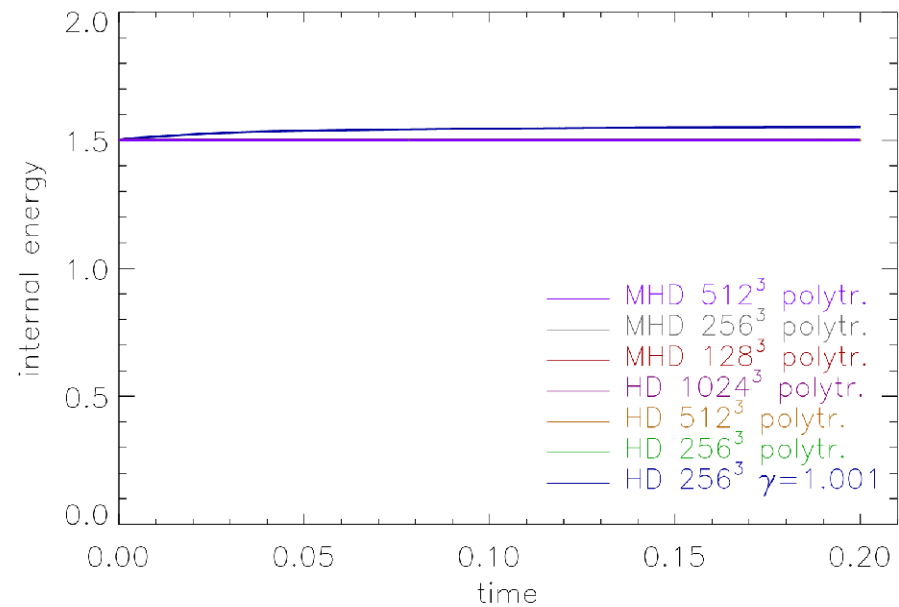

unsplit staggered mesh scheme for MHD implemented by Dongwook Lee  
(<http://flash.uchicago.edu/website/codesupport>)

HLLD Riemann solver (Miyoshi & Kusano 2005)

hybrid slope limiter (Balsara 2004)

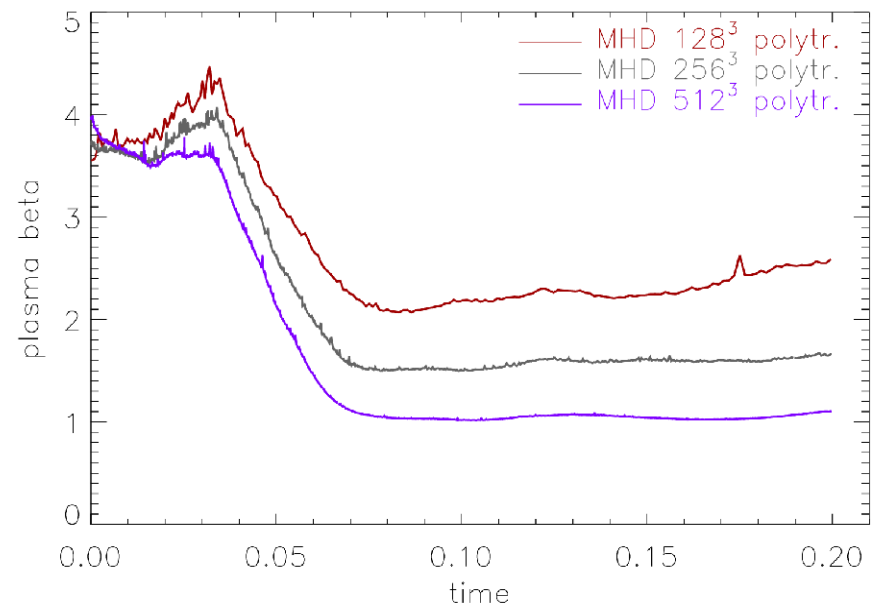

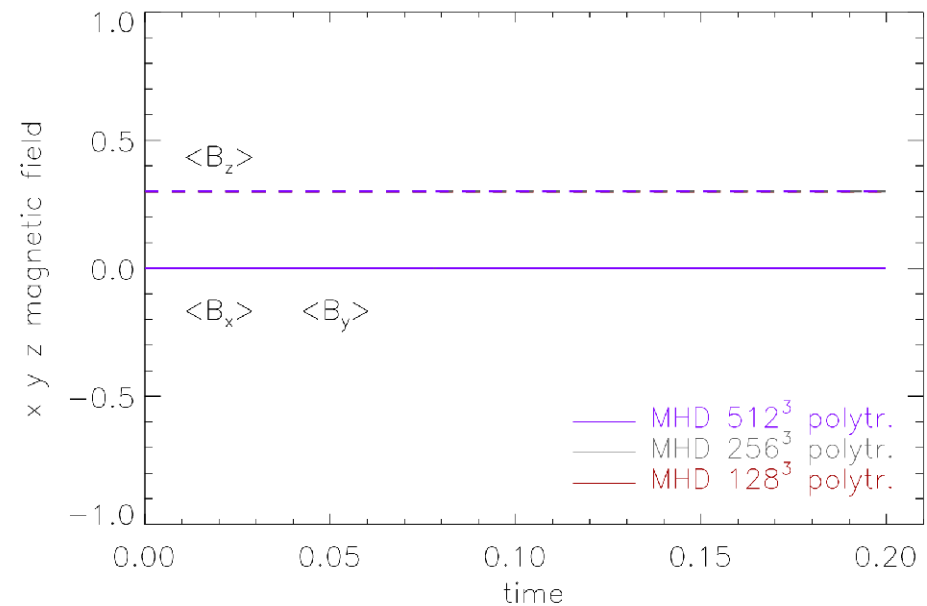

analysis in terms of projections, slices, PDFs, spectra, structure functions, time evolution plots
