A census of galactic wind activity in the local universe
Ed Elson, Gerhardt Meurer, Tim Heckman

Main goal: Quantify the incidence rate of extra-planar gas (Hα) in nearby star-forming galaxies

• Hα and R-band photometry for large HI-selected sample of HI-selected galaxies.

• 35% of all galaxies exhibit evidence for wind activity.

• At low luminosities, up to 40% of galaxies are windy.
